

## Weed Control

Basically there are 4 types of weed control.

### CONTACT

Contact weed killers such as “Weedol” containing pelargonic acid are used for treating annual weeds. The product becomes inactive on contact with the soil and this means sowing or planting can take place as soon as the weed killer has dried on the plant.

### SYSTEMIC

Systemic weed killer contains Glyphosate, which kills the weed from the inside out over a period. Examples are “Roundup” or “Tumbleweed”.

### RESIDUAL

Residual weed killer works as a barrier in the soil to prevent weed seeds germinating. An example would be “Pathclear” for use on paths and driveways etc.,

### SELECTIVE

Selective herbicides for lawns will not harm the grass but kill weeds such as clover.
